ABSTRACT OF THE DISCLOSURE

semiconductor Α laser module includes: semiconductor laser element which emits laser light; waveguide-type optical wavelength selection element which includes an optical waveguide, and selects a first portion of the laser light having a predetermined wavelength; and an optical wavelength conversion element which converts a second portion of the laser light having the predetermined wavelength to wavelength-converted laser light having a converted wavelength. The semiconductor laser element, the waveguide-type optical wavelength selection element, the optical wavelength conversion element are coupled. The semiconductor laser element contains a multiple-quantumwell active layer including a plurality of quantum-well sublayers, where one of the plurality of quantum-well sublayers is different from another of the plurality of quantum-well sublayers in thickness and/or composition.
